

About Us

Icon Medical Group is principally engaged in the provision of private nursing and caregiving services, caregiving trainings, and independent second medical opinion consultation services. Our targeted clients include the elderly, patients and persons under rehabilitation. Our aim is to ensure that our clients receive the best quality, professional and customized nursing and caregiving services at home and are able to make well-informed medical decisions, avoid undergoing unnecessary surgery operations and opt for the best course of recovery.

Our private nursing and caregiving services include home care and out-patient escorting services, 24-hour private nursing and caregiving services, and professional care assessment services. Our private nursing and caregiving services are provided by registered and enrolled nurses, mid-wives, health and personal care workers, physiotherapists, occupational therapists and registered Chinese medicine practitioners

Our caregiving trainings are conducted by registered nurses to enable domestic helpers to provide caregiving services at home. Our trainings can be conducted at our clients' homes or at our centre. Our [Certificate Course for Caregivers](#) allows students to obtain both National Caregiver Certificate from American Caregiver Association and TQUK Certificate upon successful completion of the course. We are a Hong Kong Official Representative of American Caregiver Association in the United States and an Approved Centre of TQUK in the United Kingdom.

Our mobile Internet platform also provides access to professional, reliable and efficient independent second medical opinion consultation services with our team of medical specialists who are all professionally qualified and registered in Hong Kong and are well-experienced in their own specialties. Our independent second medical opinion consultation services are provided by our medical specialists based on the medical information, records and diagnosis reports submitted by our clients and can be used as a cross-reference of the first medical opinion to minimise the risk of misdiagnosis and to avoid unnecessary surgery operations or wasting money and precious time on inappropriate treatments. According to a research published in the American Journal of Roentgenology, second medical opinion helps minimise errors in diagnosis, facilitates better medical treatment obtained by patients and the accuracy of second medical opinion is 90% higher as compared with the first medical opinion.
